Q: Simple MySQL Insert Query Not Working I have a very simple schema: CREATE TABLE `classes` ( `class\_id` INT NOT NULL AUTO\_INCREMENT, `class\_name` VARCHAR(45) NOT NULL, `class\_type` VARCHAR(15) NOT NULL, PRIMARY KEY (`class\_id`) ) ENGINE=INNODB DEFAULT CHARSET=utf8 AUTO\_INCREMENT=10 ; I'm trying to create a function to add a new class to this table and have a problem when I add the class\_type field. My code is this: CREATE FUNCTION `addClass` (className VARCHAR(45), class\_type VARCHAR(15)) RETURNS INT BEGIN DECLARE new\_class\_id INT; DECLARE new\_class\_name VARCHAR(45); SET new\_class\_name = className; SET new\_class\_id = NULL; INSERT INTO `classes` ( `class\_id`, `class\_name`, `class\_type` ) VALUES (NULL, new\_class\_name, class\_type); SET new\_class\_id = LAST\_INSERT\_ID(); RETURN new\_class\_id; END I added a couple of print statements to try and see what was happening but the query always starts with the INSERT INTO statement and doesn't contain the VALUES. INSERT INTO `classes` (`class\_id`, `class\_name`, `class\_type`) VALUES (NULL, new\_class\_name, class\_type); I know that there's something very silly wrong here but I just can't see what it is! A: You have a slight syntax error. Try this: CREATE FUNCTION `addClass` (className VARCHAR(45), class\_type VARCHAR(15)) RETURNS INT BEGIN DECLARE new\_class\_id INT; DECLARE new\_class\_name VARCHAR(45); SET new\_class\_name = class

It is possible to create your own brushes. As with most of Photoshop features you will need to learn about their use and be willing to experiment a bit. With practice you will be able to create some amazing results. When creating a new brush, create a brush shape (a closed path) and a texture. Brushes can be set up with a variety of settings, including: opacities, brush blending modes, hardness, and size. Brushes are a great tool for healing and repairing images. However, they can be quite resource intensive. This is where Smart Filters come in. Smart Filters are a way to reduce the processing and memory used by Photoshop. If there is a filtering applied to an image, and it can be removed and replaced without degrading image quality, this is called an unsharp mask. Removing and replacing the unsharp mask is typically done with a combination of Brightness and Contrast filters. A nice thing about Photoshop is that you can make adjustments for specific adjustments rather than adjusting them for the entire image. You can also make uniform adjustments across an entire image. Managing Undo is an important aspect of working with any computer program. While Photoshop is no exception, here are some tips on how to do it: • Most new Photoshop users make the mistake of clicking the X button and saving their work. • It is possible to undo multiple changes by selecting Edit > Undo or Ctrl+Z. It is a good idea to simply save your work and discard it rather than trying to correct the changes one by one. • When choosing Edit > Undo or Ctrl+Z the last operation performed is displayed in the top left corner of the new window. • For changes that can be reverted there is a button called Reverse. Clicking this button will reverse changes made in the last 30 minutes. Here are some Photoshop features every photographer should learn: The Clone Stamp allows you to copy pixels from one area of an image and paste them into another area.
